

Going deeper into the metadata: Manuscript and Object Description

James Cummings and Christopher Ohge

About Manuscript Descriptions

The TEI `<msDesc>` element is intended for several different kinds of applications:

- standalone database of library records (finding aid)
- discursive text collecting many records (catalogue raisonné)
- metadata component within a digital surrogate (electronic edition)
- tool for ‘quantitative codicology’

Manuscript description in the TEI caters for two conflicting desires:

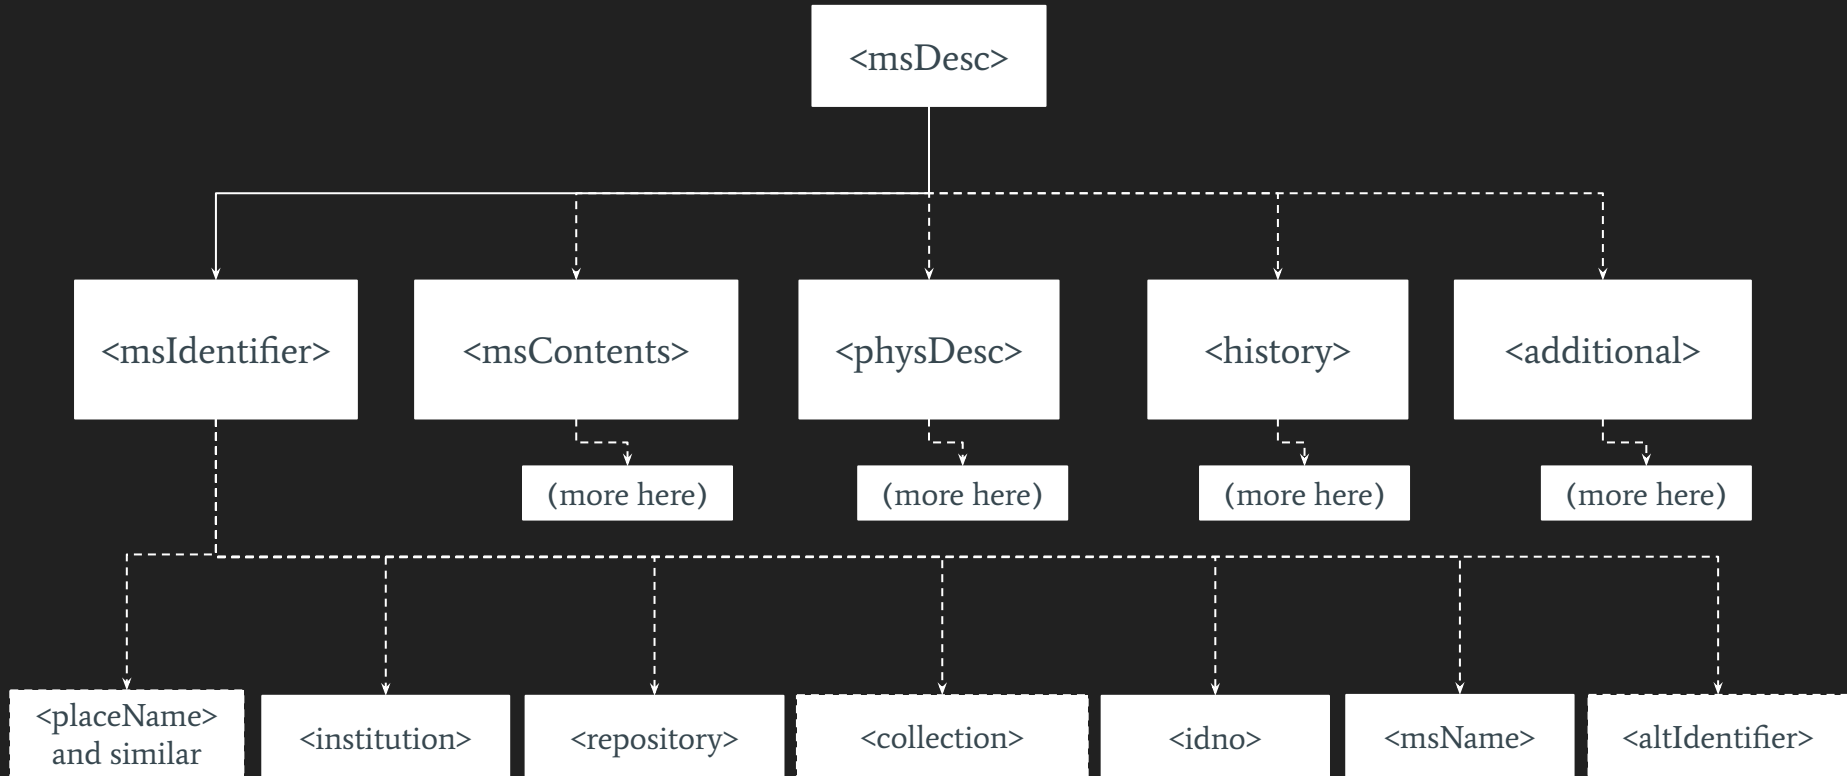

- preserve (or perpetuate) existing descriptive prose
- reliable search, retrieval, and analysis of data

The `<msDesc>` tries, wherever possible, to enable both of these approaches.

What Counts As a Manuscript?

- For the TEI manuscripts include all things written by hand, however large or small and using whatever hand held devices to make the marks
- While consciously coming out of the tradition of Western Medieval manuscripts, it has developed over time to also be used for Islamic, East Asian, and manuscripts of many other cultures, and especially modern handwritten documents
- Indeed, because manuscript descriptions are often about the means of production of the object, we actively encourage those cataloguing hand-pressed early printed books to use `<msDesc>` as well – hence the existence of elements like `<typeDesc>` to describe the forms of type used.
- Why Do We Catalogue MSS In More Detail Than Books?

<msDesc> Structure

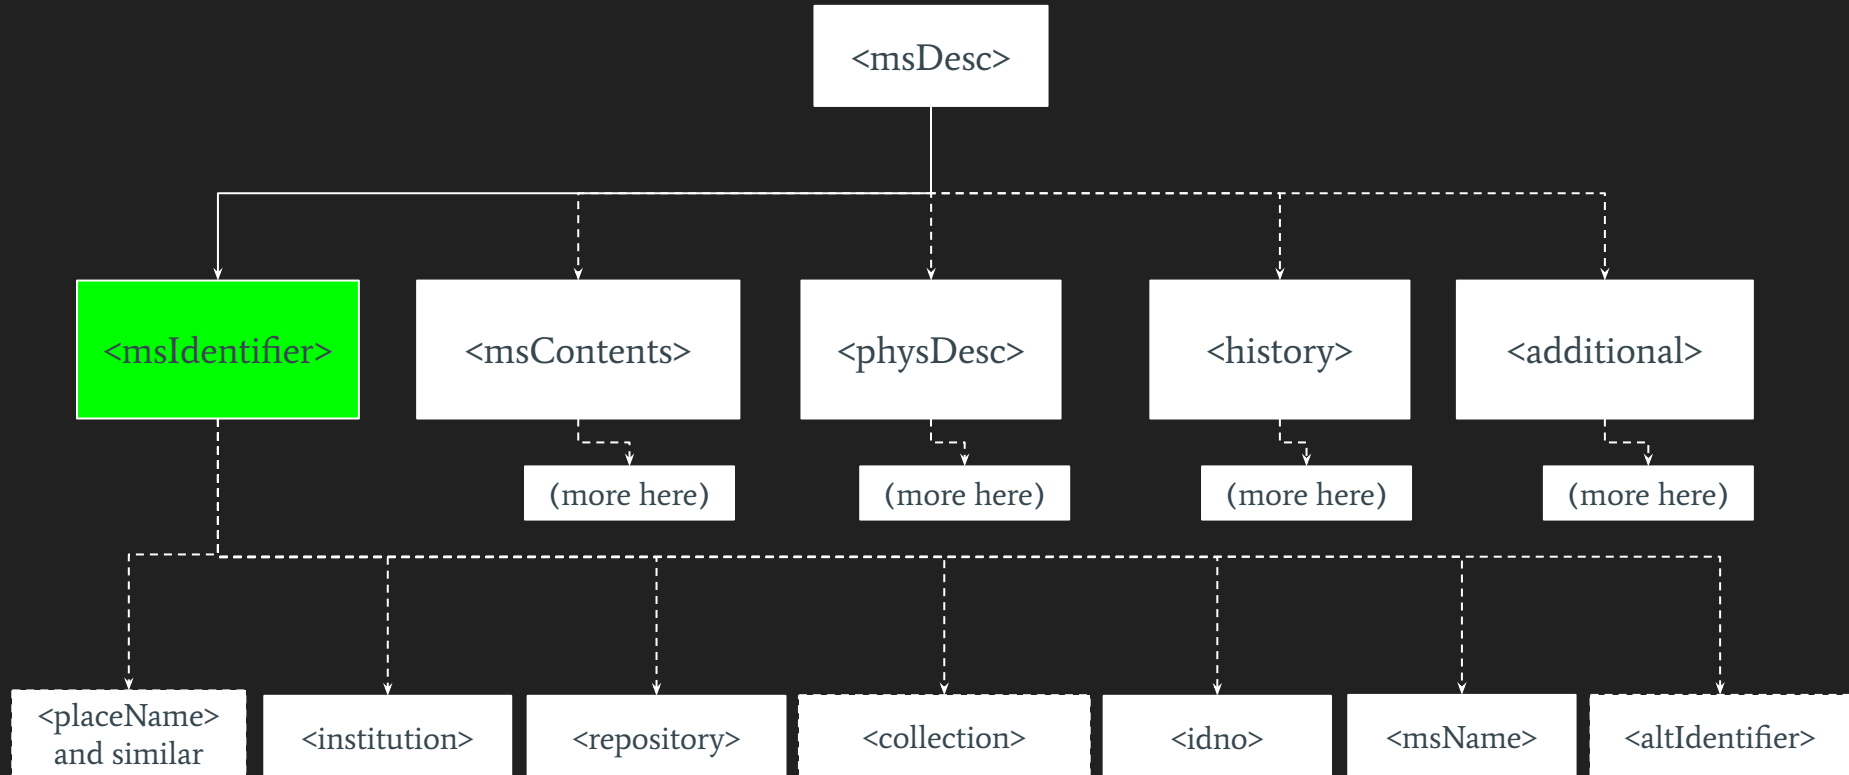

<msDesc>

- <msIdentifier>: identifying information
- <msContents>: description of intellectual contents
- <physDesc>: information on physical aspects of the manuscript
- <history>: origin, provenance, and acquisition by current holders
- <additional>: other administrative metadata or related bibliography

```
<msDesc xml:id="myFavouriteMS" xml:lang="en">
  <msIdentifier>
    <!-- Manuscript Identification -->
  </msIdentifier>
  <msContents>
    <!-- Intellectual Structure -->
  </msContents>
  <physDesc>
    <!-- Physical Description -->
  </physDesc>
  <history>
    <!-- Origin, Provenance, Acquisition -->
  </history>
  <additional>
    <!-- Additional Administrative Metadata -->
  </additional>
</msDesc>
```

<msDesc> Structure

<msDesc>

```

<msDesc>
  <msIdentifier>
    <repository>My House</repository>
    <idno>MS 1</idno>
  </msIdentifier>
  <p><!-- One or more paragraphs --></p>
</msDesc>

```

```

<msDesc>
  <msIdentifier>
    <repository>My House</repository>
    <idno>MS 1</idno>
  </msIdentifier>
  <msContents><p><!-- One or more paragraphs --></p></msContents>
  <physDesc><p><!-- One or more paragraphs --></p></physDesc>
  <history><p><!-- One or more paragraphs --></p></history>
</msDesc>

```

<msDesc>

```

<msDesc>
  <msIdentifier>
    <!-- More detailed location information -->
    <repository>My House</repository>
    <idno>MS 1</idno>
  </msIdentifier>
  <msContents>
    <summary> <!-- summary description --></summary>
    <msItem>
      <bibl><!-- bibliographic description of item --></bibl>
    </msItem>
  </msContents>
  <physDesc>
    <!-- accMat additions bindingDesc decoDesc
      handDesc musicNotation objectDesc
      scriptDesc sealDesc typeDesc
    -->
  </physDesc>
  <history>
    <origin><!-- where it started --></origin>
    <provenance><!-- one or more provenance steps --></provenance>
    <acquisition><!-- how current institution got it --></acquisition>
  </history>
</msDesc>

```

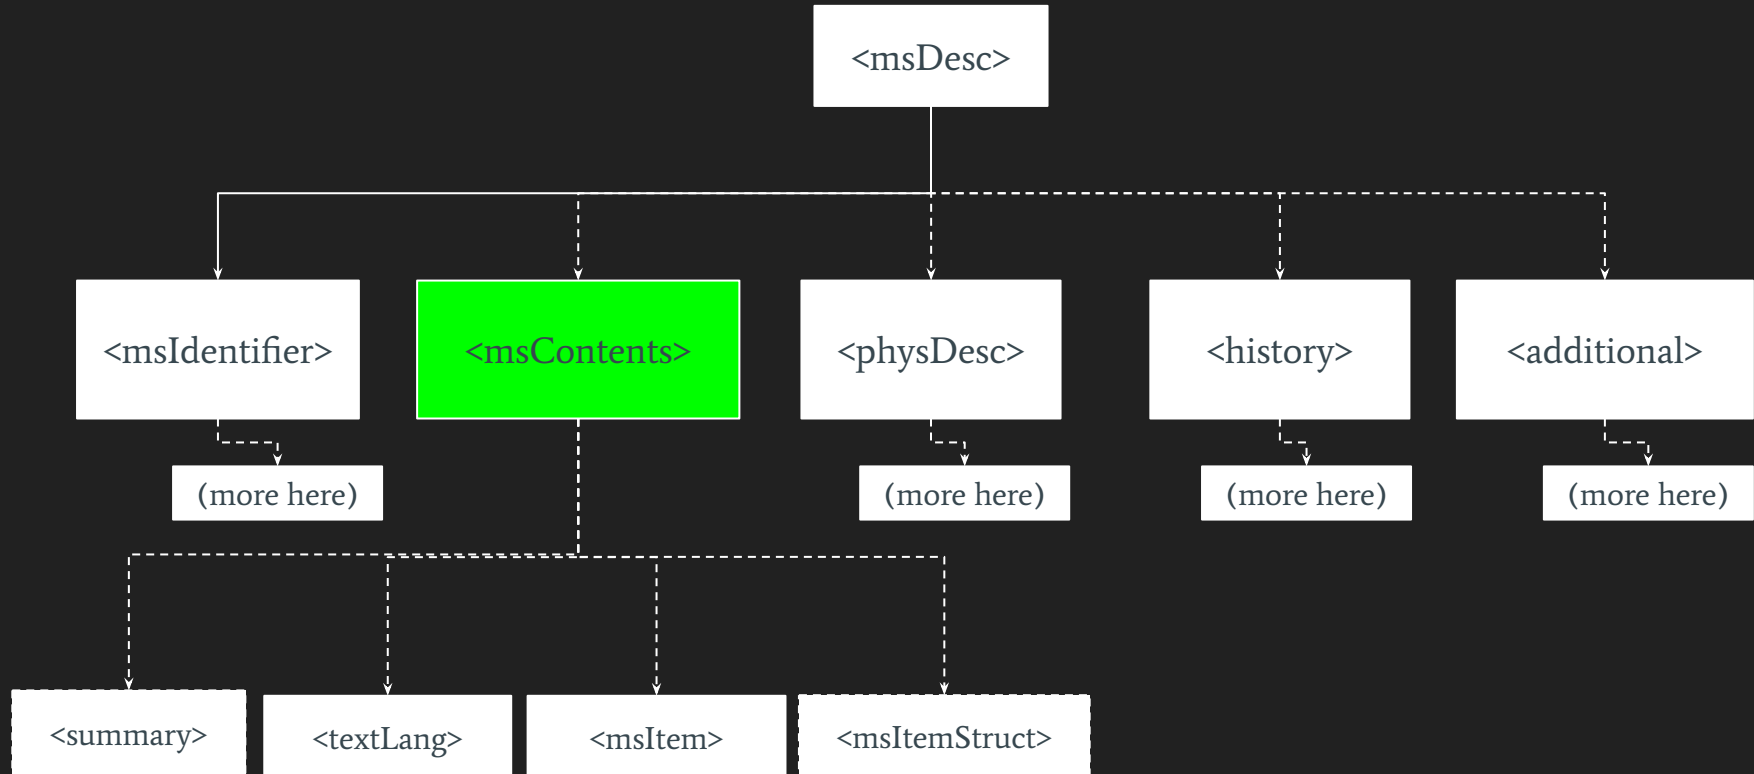

<msIdentifier>

The <msIdentifier> element has a traditional manuscript location three part specification:

- place: <country>, <region>, <settlement>, <placeName>, etc.
- repository: <institution>, <repository>
- identifier: <collection>, <idno>, <altIdentifier>

```
<msIdentifier>
  <country>United Kingdom</country>
  <region type="county">Oxfordshire</region>
  <settlement>Oxford</settlement>
  <institution>University of Oxford</institution>
  <repository>Bodleian Library</repository>
  <collection>Digby</collection>
  <idno type="shelfmark">MS. Digby 133</idno>
  <altIdentifier type="internal">
    <idno type="SCN">1734</idno>
  </altIdentifier>
</msIdentifier>
```

<msDesc> Structure

<msContents>

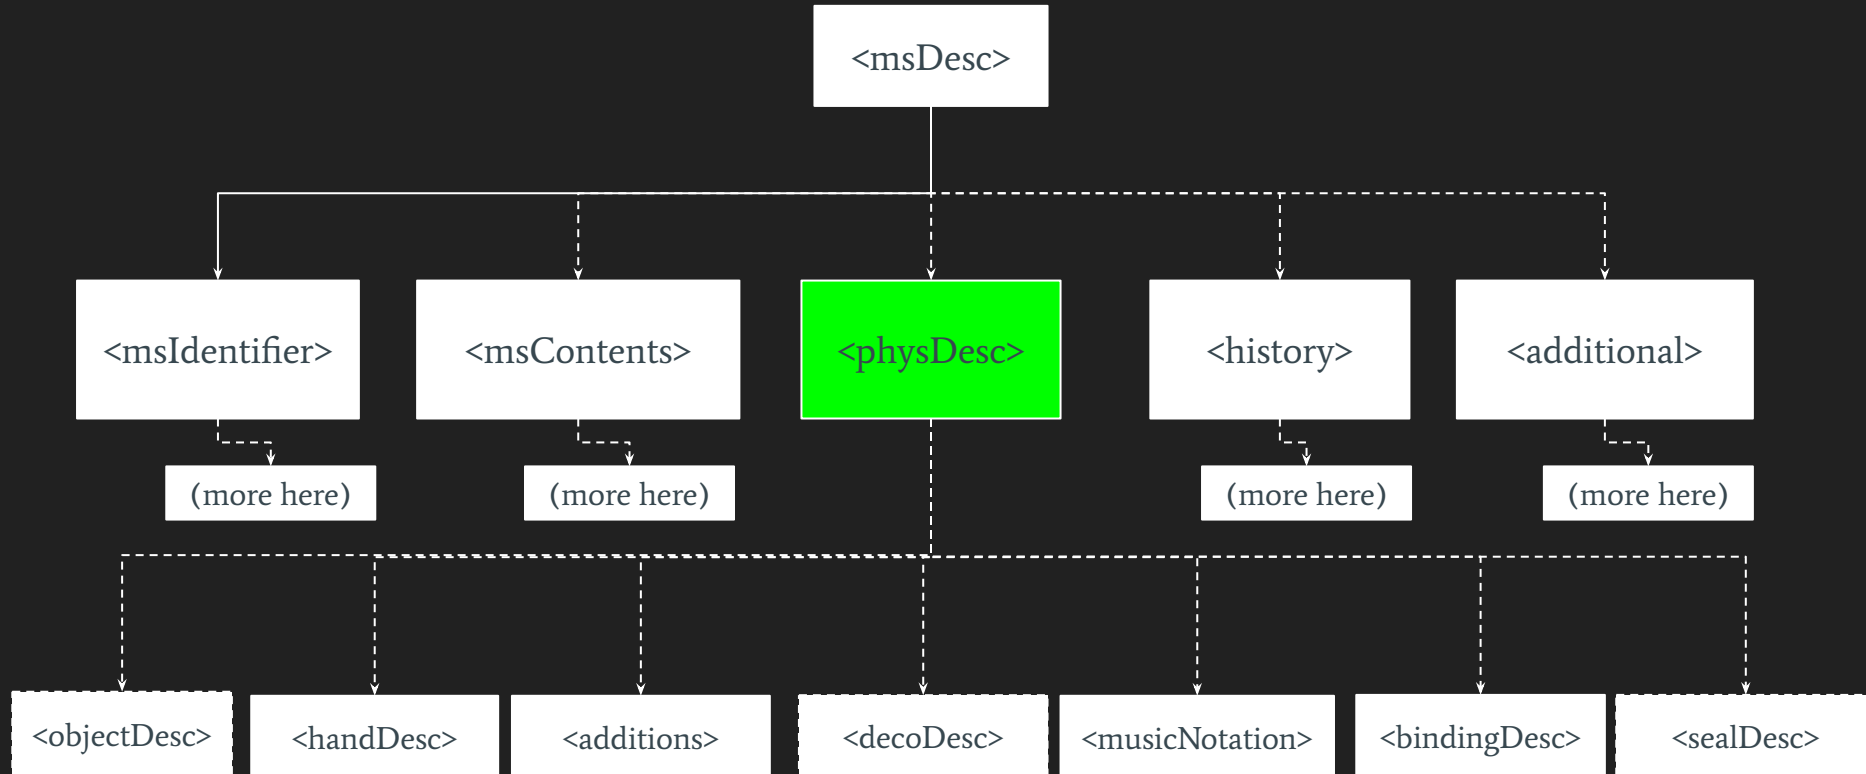

- The <msContents> element contains information about the intellectual content of the manuscript
- Multiple <msItem> elements provide a detailed table of contents
- You can use the <locus> element inside to document where that particular item appears

```
<msContents>
  <msItem n="1">
    <locus from="1r" to="4v">fol. 1r - fol. 4v</locus>
    <p>Description of this item</p>
  </msItem>
  <msItem n="2">
    <locus from="5r" to="55v">fol. 5r - fol. 55v</locus>
    <msItem n="2.1">
      <locus from="5r" to="15v">fol. 5r - fol. 15v</locus>
      <p>Description of this sub-item</p>
    </msItem>
    <msItem n="2.2">
      <locus from="16r" to="55v">fol. 16r - fol. 55v</locus>
      <p>Description of this sub-item</p>
    </msItem>
  </msItem>
  <msItem n="3">
    <locus from="56r" to="109r">fol. 56r - fol. 109r</locus>
    <p>Description of this item</p>
  </msItem>
</msContents>
```

<msContents>

```
<msContents>
  <summary><!-- Optional overview summary of contents --></summary>
  <textLang xml:lang="shn-shn">Written in shan script</textLang>
  <msItem n="W107">

10 Manuscript Description

10.1 Overview

The `msdescription` module¹⁰ defines a special purpose element which can be used to provide detailed descriptive information about handwritten primary sources. Although originally developed to meet the needs of cataloguers and scholars working with medieval manuscripts in the European tradition, the scheme presented here is general enough that it can also be extended to other traditions and materials, and is potentially useful for any kind of inscribed artefact.

The scheme described here is also intended to accommodate the needs of many different classes of encoders. On the one hand, encoders may be engaged in *retrospective conversion* of existing detailed descriptions and catalogues into machine tractable form; on the other, they may be engaged in cataloguing *ex nihilo*, that is, creating new detailed descriptions for materials never before catalogued. Some may be primarily concerned to represent accurately the description itself, as opposed to the ideas and interpretations the description represents; others may have entirely opposite priorities. At one extreme, a project may simply wish to capture an existing catalogue in a form that can be displayed on the Web, and which can be searched for literal strings, or for such features such as titles, authors and dates; at the other, a project may wish to create, in highly structured and encoded form, a detailed database of information about the physical characteristics, history, interpretation, etc. of the material, able to support practitioners of *quantitative codicology* as well as librarians.

To cater for this diversity, here as elsewhere, these Guidelines propose a flexible strategy, in which encoders must choose for themselves the approach appropriate to their needs, and are provided with a choice of encoding mechanisms to support those differing degrees.

10.2 The Manuscript Description Element

The `msDesc` element will normally appear within the `sourceDesc` element of the header of a TEI-conformant document, where the document being encoded is a digital representation of some manuscript original, whether as an encoded transcription, as a collection of digital images (as described in [11.1 Digital Facsimiles](#)), or as some combination of the two. However, in cases where the document being encoded is essentially a collection of manuscript descriptions, the `msDesc` element may be used in the same way as the bibliographic elements (`bibl`, `biblFull`, and `biblStruct`) making up the TEI element class `model.bibliLike`. These typically appear within the `listBibl` element.

`<msDesc>` (manuscript description) contains a description of a single identifiable manuscript or other text-bearing object.

The `msDesc` element has the following components, which provide more detailed information under a number of headings. Each of these component elements is further described in the remainder of this chapter.

`<msIdentifier>` (manuscript identifier) contains the information required to identify the manuscript or similar object being described.

`<head>` (heading) contains any type of heading, for example the title of a section, or the heading of a list, glossary, manuscript description, etc.

`<msContents>` (manuscript contents) describes the intellectual content of a manuscript, manuscript part, or other object either as a series of paragraphs or as a series of structured manuscript items.
